Federal Programs Provide Screening and Treatment for Breast and Cervical Cancer

GAO Highlights

Highlights of [GAO-21-35](#), a report to the Chairman of the Committee on Finance, U.S. Senate

Why GAO Did This Study

According to the CDC, tens of thousands of people die each year from breast or cervical cancer. Early screening and detection, followed by prompt treatment, can improve outcomes and, ultimately, save lives. Federal programs, like CDC's Early Detection Program, are intended to improve access to these services.

GAO was asked to examine the implementation of the Early Detection Program and the states' use of Medicaid under the Treatment Act. This report provides information on the number of people who were 1) screened through the Early Detection Program and 2) enrolled in Medicaid under the Treatment Act.

GAO analyzed CDC data on the number of people screened by the Early Detection Program from calendar years 2011 through 2018—the most recent available. GAO also analyzed CMS Medicaid enrollment data from 2016 through 2019—the most recent available. Additionally, GAO reviewed a 2020 study funded by CDC that examines the number of people eligible for the Early Detection Program from 2011 through 2017. Finally, GAO interviewed CDC and CMS officials and reviewed relevant CDC and CMS documents.

Federal Programs Provide Screening and Treatment for Breast and Cervical Cancer

What GAO Found

The Centers for Disease Control and Prevention (CDC) operates the National Breast and Cervical Cancer Early Detection Program (the Early Detection Program) to provide cancer screening and diagnostic services to people who are low-income and uninsured or underinsured. For those screened under the program who require treatment, the Breast and Cervical Cancer Prevention and Treatment Act of 2000 (the Treatment Act) allows states to extend Medicaid eligibility to individuals not otherwise eligible for Medicaid.

GAO analysis of CDC data show that the Early Detection Program screened 296,225 people in 2018, a decrease from 550,390 in 2011 (about 46 percent). The largest decrease occurred from 2013 to 2014 (see figure). According to a CDC-funded study, the number of people eligible for the Early Detection Program decreased from 2011 through 2017, by about 48 percent for breast cancer and about 49 percent for cervical cancer. CDC officials attributed these declines in screening and eligibility, in part, to improved access to screening under the Patient Protection and Affordable Care Act (PPACA). For example, PPACA required health plans to cover certain women's preventive health care with no cost sharing.

Number of People Screened by CDC's Early Detection Program, 2011-2018

Source: GAO analysis of data from the Centers for Disease Control and Prevention (CDC). | GAO-21-35

GAO analysis of Centers for Medicare & Medicaid Services' (CMS) data found that, in 2019, 43,549 people were enrolled in Medicaid under the Treatment Act to receive treatment for breast or cervical cancer, a decrease from 50,219 in 2016 (13.3 percent). Thirty-seven states experienced a decrease in Medicaid enrollment under the Treatment Act during this time period, 13 states experienced an increase, and one state had no change. CMS officials noted that Medicaid expansion to adults with incomes at or below 133 percent of the federal poverty level under PPACA (the new adult group) is a key factor that contributed to these enrollment trends. CMS officials said that, in Medicaid expansion states, there were some people who previously would have enrolled in Medicaid based on eligibility under the Treatment Act who instead became eligible for Medicaid in the new adult group. The CMS data show that total enrollment under the Treatment Act in Medicaid expansion states decreased by 25.6 percent from 2016 to 2019. In contrast, total enrollment under the Treatment Act in non-expansion states increased by about 1 percent during this time period.

October 28, 2020

The Honorable Charles E. Grassley
Chairman
Committee on Finance
United States Senate

Dear Chairman Grassley:

According to the Centers for Disease Control and Prevention (CDC), tens of thousands of people die each year from breast or cervical cancer.¹ In 2017, the most recent year of data available from the CDC, about 251,000 women in the United States were diagnosed with breast cancer and about 42,000 died of the disease. While cervical cancer is less common than breast cancer, CDC data show that nearly 13,000 women were diagnosed with cervical cancer in the United States in 2017 and about 4,200 died. Early screening and detection, followed by prompt treatment, can improve outcomes and, ultimately, save lives. Yet, research has shown that low-income, uninsured, and underinsured people face challenges accessing timely screening and treatment for breast and cervical cancer.²

To improve access to screening and diagnostic services for these underserved and high-risk populations, since 1991, CDC has administered the National Breast and Cervical Cancer Early Detection Program (which we refer to as the Early Detection Program) to provide cancer screening and diagnostic services to low-income and uninsured and underinsured individuals.³ In addition, under the Breast and Cervical

¹Centers for Disease Control and Prevention, *United States Cancer Statistics: Data Visualizations*, accessed June 22, 2020, www.cdc.gov/cancer/dataviz.

²See, for example, CDC, "Cancer Screening Test Use – United States, 2015," *Morbidity and Mortality Weekly Report*, vol. 66, no. 8 (2017); and G. Zhao et al. "Health Insurance Status and Clinical Cancer Screenings Among U.S. Adults," *American Journal of Preventive Medicine*, vol. 54, no. 1 (2018).

³The Early Detection Program was authorized by the Breast and Cervical Cancer Mortality Prevention Act of 1990, Pub. L. No. 101-354, 104 Stat. 409 (1990) (codified, as amended, at 42 U.S.C. §§ 300k, et seq.).

CDC defines eligibility for the Early Detection Program as those who are low-income and uninsured or underinsured, such as those who cannot afford large out-of-pocket cost sharing required by their health insurance plan.

Cancer Prevention and Treatment Act of 2000 (which we refer to as the Treatment Act), states have the option to extend coverage for breast and cervical cancer treatment under Medicaid, the joint federal-state health financing program for low-income and medically needy individuals.⁴ Medicaid programs are administered at the state level and overseen at the federal level by the Centers for Medicare & Medicaid Services (CMS). Since we last reported on these programs in 2009, the Patient Protection and Affordable Care Act (PPACA) was enacted, which included provisions that increased insurance coverage and affected cancer screening.⁵ For example, PPACA gave states the authority to expand their Medicaid programs to low-income adults and required health plans to cover certain women’s preventive health care with no cost sharing.

To help inform Congress on the implementation and effectiveness of these programs, you asked us to examine how many people have been screened through the Early Detection Program and treated by Medicaid under the Treatment Act. This report provides information on

1. the number of people screened by CDC’s Early Detection Program and
2. the number of people enrolled in Medicaid under the Treatment Act.

To determine the number of people screened through the Early Detection Program, we analyzed CDC data on the number of people screened and diagnosed for breast and cervical cancer by the Early Detection Program

⁴Pub. L. No. 106-354, 114 Stat. 1381 (2000) (codified, as amended, at 42 U.S.C. §§ 1396a, 1396b, 1396d, 1396r-1b). In addition, states may extend this Medicaid coverage to American Indians and Alaska Natives who are eligible for health services provided by the Indian Health Service or by a tribal organization. Pub. L. No. 107-121, 115 Stat. 2384 (2002) (codified, as amended, at 42 U.S.C. § 1396a(aa)). U.S. territories may also extend this optional Medicaid coverage to eligible individuals.

⁵GAO, *Medicaid: Source of Screening Affects Women’s Eligibility for Coverage of Breast and Cervical Cancer Treatment in Some States*, [GAO-09-384](#), (Washington, D.C.: May 22, 2009).

Pub. L. No. 111-148, 124 Stat. 119 (2010), as amended by the Health Care and Education Reconciliation Act of 2010, Pub. L. No. 111-152, 124 Stat. 1029 (2010). For purposes of this report, references to PPACA include the amendments made by the Health Care and Education Reconciliation Act of 2010.

from calendar years 2011 through 2018, both nationally and by grantee.⁶ We examined this time period in order to capture data before and after the implementation of PPACA. In addition, 2018 was the most recent full calendar year of data available.⁷ We present data on 67 of the 70 current grantees because data were unavailable for three grantees that were new to the Early Detection Program in 2017.⁸ We also reviewed the results of a 2020 study funded by CDC that estimated the number of women eligible for the Early Detection Program in the 50 states and Washington, D.C., each year from 2011 through 2017.⁹ These estimates are likely an underestimate due to the exclusion of underinsured women, among other reasons noted in the study.¹⁰ We also spoke to CDC officials and representatives from two national cancer advocacy groups—Susan G. Komen and the American Cancer Society—to learn more about the program. We assessed the reliability of the CDC dataset by checking for

⁶There are currently 70 Early Detection Program grantees, which include state, territorial, and tribal health departments and other tribal organizations. Breast cancer screening includes clinical breast exams and mammograms. Cervical cancer screening includes Pap tests and human papilloma virus tests.

We did not analyze screening data by sex or gender because CDC does not track this information; however, cisgender women, transgender women, and transgender men may all be eligible for screening under the Early Detection Program if they meet eligibility and screening criteria. Cisgender men are not eligible—according to the CDC, less than one percent of all breast cancer cases occur in men. The term “cisgender” refers to a person whose gender identity corresponds with the sex that person was identified as having at birth, while the term “transgender” refers to a person whose gender identity differs from the sex that person was identified as having at birth. We use the gender-neutral term “people” throughout this report, except where gendered language is necessary to be consistent with agency reporting.

⁷The last complete year of final diagnosis data available was 2017 because, according to CDC officials, there is a time lag between when people are screened and when their final diagnosis data are received.

⁸These grantees are Great Plains Tribal Chairmen’s Health Board, American Indian Cancer Foundation, and the Republic of the Marshall Islands. In addition to the 70 current grantees, the Poarch Band of Creek Indians was a grantee until 2012 and then discontinued participation in the program. We present data for the years this grantee participated.

⁹The CDC awards Early Detection Program funding to the U.S. territories and tribes via cooperative agreements, but the study does not report separately for these groups. Florence Tangka et al., “The Eligibility and Reach of the National Breast and Cervical Cancer Early Detection Program after Implementation of the Affordable Care Act,” *Cancer Causes & Control*, vol. 31 (2020): pp. 473-489.

¹⁰CDC officials told us that they do not have a source of data that would enable them to estimate the size of the underinsured population.

missing values and obvious errors, reviewing relevant CDC documents, and speaking to CDC officials. We determined the CDC data were sufficiently reliable for the purposes of our reporting objective.

To determine the number of people enrolled in Medicaid under the Treatment Act, we analyzed CMS Medicaid enrollment data from 2016 through 2019 for the 50 states and the District of Columbia.¹¹ We examined this time period because, according to CMS officials, 2016 was the first year in which a complete calendar year of data became available for all states.¹² In addition, 2019 was the most recent full calendar year of data available. Specifically, in the data, we analyzed the eligibility group variable to identify individuals whose basis for Medicaid eligibility was the “Certain Individuals Needing Treatment for Breast or Cervical Cancer” group code during at least one month of the year.¹³ We also spoke to CMS officials and representatives from the two national cancer advocacy groups to learn more about the program. We assessed the reliability of the dataset used in our analysis by checking for missing values and obvious errors, reviewing relevant CMS documents, and speaking to CMS officials. We analyzed the Medicaid enrollment data as they were reported by states to CMS and we did not independently verify the accuracy or completeness of the Medicaid enrollment information with the

¹¹We analyzed Medicaid enrollment by sex (according to a binary male/female classification) because both women and men may be eligible. We did not analyze Medicaid enrollment by gender because CMS’s data do not track this information. As a result, we could not determine how many enrollees were cisgender and how many were transgender.

Because, according to CMS officials, only the U.S. Virgin Islands has elected to provide coverage under the Treatment Act, we did not examine Medicaid data from U.S. territories. While territories have the option of extending this Medicaid coverage to eligible people, Puerto Rico and Guam have not elected to provide this coverage and American Samoa and the Commonwealth of the Northern Mariana Islands operate their Medicaid programs under different guidelines and a different state plan format than other jurisdictions, according to CMS.

¹²We analyzed enrollment data accessed on September 2, 2020, from the Transformed Medicaid Statistical Information System Analytic File, a national Medicaid dataset administered by CMS. This dataset replaced CMS’s prior Medicaid dataset, the Medicaid Statistical Information System, which we used in our prior report; see [GAO-09-384](#). We have previously reported on data challenges associated with the ongoing development and implementation of the Transformed Medicaid Statistical Information System. GAO, *Medicaid: Further Action Needed to Expedite Use of National Data for Program Oversight*, [GAO-18-70](#) (Washington, D.C.: Dec. 8, 2017). See also GAO, *Medicaid Eligibility: Accurate Beneficiary Enrollment Requires Improvements in Oversight, Data, and Collaboration*, [GAO-20-147T](#) (Washington, D.C.: Oct. 30, 2019).

¹³For Tennessee in 2016, we derived data from the “Medicaid Basis of Eligibility” variable due to data reliability concerns with the eligibility group variable for that state in that year.

states. We determined the CMS data were sufficiently reliable for the purposes of our reporting objective.

We conducted this performance audit from December 2019 to October 2020 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

Early Detection Program Structure and Eligibility Requirements

The Early Detection Program is implemented through cooperative agreements between the CDC and 70 grantees—health departments in the 50 states, the District of Columbia, and six U.S. territories, as well as 13 tribes and tribal organizations. In addition to CDC funding, all grantees are required to provide non-federal matching funds. According to self-reported data from the grantees for the 2018 to 2019 program year, about 63 percent of grantees have acquired state-appropriated funds to support their programs, 10 percent of grantees have acquired additional federal resources, and about 21 percent of grantees have acquired funds from non-profits.¹⁴ Grantees typically provide the screenings through a network of local providers, such as community health centers and private providers. To ensure that people receive complete screening, the Early Detection Program provides diagnostic testing and follow-up services for those whose screening results are abnormal, although treatment is not provided with Early Detection Program funds.¹⁵

The Early Detection Program funds breast and cervical cancer screening services for people who are uninsured or underinsured, have an income

¹⁴CDC officials explained that “state-appropriated funds” are funds appropriated by the state legislature specifically for breast or cervical cancer screening. Although grantees are required to provide non-federal matching funds, CDC officials said that these can also take the form of cash (non-appropriated funds) or in-kind services.

¹⁵Additionally, in a small number of cases each year, the Early Detection Program also provides diagnostic services to people who did not receive CDC-funded screening services through the program, according to CDC. This may occur when people are referred into the program after receiving screening services elsewhere or if a person is underinsured and their health insurance does not fully cover diagnostic services or covers them, but with substantial cost sharing.

equal to or less than 250 percent of the federal poverty level, are aged 40 through 64 for breast cancer screenings or aged 21 through 64 for cervical cancer screenings, and meet clinical cancer screening guidelines.¹⁶ Within this population, CDC prioritizes and sets screening targets for certain groups; specifically, CDC expects that 75 percent or more of the people grantees screen for breast cancer will be women aged 50 to 64 and that 20 percent or more of the people grantees screen for cervical cancer will be women who have never been screened. Individual grantees also have some flexibility to set their own eligibility requirements, which may be broader or narrower than these CDC targets.¹⁷

CDC also prioritizes other groups for screening without setting screening targets, based on a group's disproportionate risk of developing cancer or a lack of adequate health care options for prevention or treatment. For example, according to CDC, Black women have a similar incidence rate for breast cancer compared with White women but are approximately 40 percent more likely to die from the disease, and CDC specifically highlights Black women as a population that would benefit from the Early Detection Program.¹⁸ Although health disparities are often considered in the context of race or ethnicity, other population groups may experience health disparities. According to CDC, these include groups that may be

¹⁶For example, women who have had total hysterectomies for benign disease are not eligible for cervical cancer screening through the Early Detection Program in accordance with recommendations from the U.S. Preventive Services Task Force and other organizations. Further, in accordance with recommendations from the Center of Excellence for Transgender Health, the Early Detection Program may cover breast cancer screening for transgender women if they have taken or are taking hormones, and transgender men may be eligible for breast and cervical cancer screening if they have not undergone a bilateral mastectomy or a total hysterectomy, respectively.

People outside of the standard age ranges may also be eligible for screening under certain circumstances. For example, people who are symptomatic or at high-risk for breast cancer (due to conditions such as the BRCA 1 or 2 genetic mutations) are eligible for breast cancer screening under age 40.

¹⁷According to CDC's most recent annual grantee survey, while the majority of grantees use the same minimum screening ages and income threshold targeted by CDC, two grantees use a lower minimum age for breast cancer screening; 21 grantees use a higher minimum age for breast cancer screening; 18 grantees use a higher minimum age for cervical cancer screening; and 15 grantees use a lower income threshold. Additionally, 63 grantees extend eligibility to underinsured people, while 7 do not.

¹⁸Lisa C. Richardson et al., *Patterns and Trends in Age-Specific Black-White Differences in Breast Cancer Incidence and Mortality – United States, 1999-2014*, Morbidity and Mortality Weekly Report, vol. 65, no. 40 (2016).

defined by disability, sexual orientation, gender identity, geographic location, or socioeconomic status. Early Detection Program grantees are required to identify these types of target populations and are then responsible for educating and motivating them to seek screening and ensuring that services are accessible and provided in a culturally competent manner.

Treatment Act Option and Eligibility Requirements

To address concerns that the Early Detection Program did not include a treatment component for people who received a cancer diagnosis, the Treatment Act was enacted in 2000 to allow states to extend Medicaid eligibility to those in need. Under the law, states can opt to extend Medicaid eligibility to those who are under age 65, do not have other creditable coverage for cancer treatment,¹⁹ are otherwise not eligible for Medicaid, and have been (1) screened under CDC’s Early Detection Program and (2) found to be in need of treatment for breast or cervical cancer, including for precancerous conditions.²⁰

We previously reported that, as of 2008, all states and the District of Columbia had opted to extend this Medicaid eligibility to those determined to be in need of treatment through the Early Detection Program.²¹ We also noted that states have flexibility regarding beneficiary eligibility. Specifically, CMS defines “screened under the Early Detection Program” as including people under any of three categories: (1) those whose clinical services under the Early Detection Program were provided all or in part with CDC funds; (2) those screened by a CDC-funded provider within the scope of the state’s Early Detection Program, even if CDC funds did not pay for the particular service; or (3) those screened by a non-CDC-funded provider whom the state has elected to include as part of its Early

¹⁹For purposes of this group, CMS defines “creditable coverage” as coverage under a group health plan; comprehensive health insurance; Medicare Part A or Part B; full-benefit Medicaid; health coverage of the military and uniformed services; health coverage of employees of Congress and the District of Columbia; and a state health benefits risk pool. The term expressly excludes medical care programs of the Indian Health Service or of a tribal organization.

²⁰States must provide full Medicaid coverage for the period when the enrollee needs treatment for breast or cervical cancer. After the initial period of eligibility based on screening through the Early Detection Program and determination of the need for breast or cervical cancer treatment, eligibility may be continued based on the determination of an individual’s treating health professional.

²¹[GAO-09-384](#).

Detection Program.²² Early Detection Program grantees determine who is considered to have been screened under their program. When we previously reported, 16 states and the District of Columbia extended eligibility only to those screened or diagnosed with CDC funds, while the remaining 34 states used a broader definition of “screened under the Early Detection Program.”

Changes Made by the Patient Protection and Affordable Care Act

PPACA gave states the authority to expand their Medicaid programs (which we refer to as Medicaid expansion) to cover adults ages 19 through 64 who are not pregnant, not entitled to Medicare, and with household incomes at or below 133 percent of the federal poverty level beginning January 1, 2014 (which we refer to as the new adult group).²³ Historically, eligibility for Medicaid had been limited to certain categories of low-income individuals, including children, parents, pregnant women, and individuals who have disabilities or who are aged 65 and older. As of July 2020, 35 states and the District of Columbia had opted to expand their Medicaid programs and, according to CMS, three states planned to expand Medicaid later in 2020 or in 2021.²⁴ In addition, PPACA required the creation of health insurance exchanges—marketplaces where individuals and small employers can compare and select among insurance plans offered by participating private health plans.²⁵ PPACA also improved coverage of breast and cervical cancer screening by

²²Although cisgender men are not eligible for CDC-funded screening through the Early Detection Program, a cisgender man may still be eligible for Medicaid enrollment under the Treatment Act through one of these broader definitions of “screened under the Early Detection Program”, according to CMS guidance, such as when a CDC-funded Early Detection Program provider screens a man without using CDC funds. See Centers for Medicare and Medicaid Services, *Implementation Guide: Medicaid State Plan Eligibility, Individuals Needing Treatment for Breast or Cervical Cancer* (2020).

²³PPACA also permitted an early expansion option, whereby states could expand eligibility for this population, or a subset of this population, starting on April 1, 2010. Additionally, PPACA provides for a disregard equivalent to 5 percent of the federal poverty level when calculating income for determining Medicaid eligibility for most individuals, which effectively increases income eligibility from 133 percent of the federal poverty level to 138 percent of the federal poverty level for the new adult group.

²⁴According to CMS, Nebraska plans to expand Medicaid on October 1, 2020; Oklahoma and Missouri are planning to expand Medicaid by July 1, 2021.

²⁵Certain consumers purchasing health insurance through the exchanges are eligible for premium tax credits and cost-sharing reductions that reduce their out-of-pocket costs for health insurance. Individuals with incomes between 100 and 400 percent of the federal poverty level may qualify for premium tax credits, and those with incomes between 100 and 250 percent may qualify for cost-sharing reductions.

requiring health plans to cover certain women’s preventive health care with no cost sharing.²⁶

CDC’s Early Detection Program Screened nearly 300,000 People in 2018, Reflecting an Overall Decline in Screening and Eligibility

According to data from CDC, 296,225 people were screened for breast or cervical cancer by the Early Detection Program in 2018, a decrease from 550,390 in 2011 (about 46 percent).²⁷ (See fig. 1.) The largest decrease occurred from 2013 to 2014—the first year that several key PPACA provisions went into effect, including Medicaid expansion and the implementation of health insurance exchanges and subsidies, such as premium tax credits and cost-sharing reductions, to help people purchase health plans. According to CDC officials, health insurance coverage expansions and improved access to screening under PPACA were significant factors, among others, contributing to a decrease in the number of people who were eligible and, subsequently, a decrease in those screened. Other factors that can influence the number of people a grantee is able to screen include the amount of CDC funding awarded, the availability of other resources, changes in screening guidelines, and changes in clinical costs, such as more costly screening technologies.²⁸ (See app. I, tables 1-3 for screening data at the grantee level.)

²⁶Diagnostic and treatment services may be subject to cost-sharing.

²⁷This number is unduplicated, meaning that people who received multiple screenings—such as both a breast cancer screening and a cervical cancer screening—in the same year are counted only once. It does not include the small number of people who received diagnostic services through the program without receiving CDC-funded screening services, although that number also decreased through 2017. In 2017 (the most recent full calendar year for which diagnostic data were available), 11,894 people received breast cancer diagnostic services and 5,810 people received cervical cancer diagnostic services without first receiving CDC-funded screening services, decreases of 14.8 and 54.1 percent, respectively, from 2011.

²⁸For example, in March 2012, the U.S. Preventive Services Task Force changed the minimum recommended age for cervical cancer screening, increasing it from 18 years old to 21 years old, and cervical cancer screening intervals increased from 3 years to 5 years for some women.

Figure 1: People Screened by CDC’s National Breast and Cervical Cancer Early Detection Program, 2011 through 2018

Number (in thousands)

Source: GAO analysis of data from the Centers for Disease Control and Prevention (CDC). | GAO-21-35

^aThe total number of unduplicated people screened means that individuals who received multiple screenings in the same year, such as both a breast cancer screening and a cervical cancer screening are counted only once.

The number of people eligible for screening through the Early Detection Program also decreased by about half from 2011 through 2017, according to a CDC-funded study. Specifically, the authors estimated that the number of women eligible for screening through the Early Detection program decreased from approximately 5.4 million in 2011 to approximately 2.8 million in 2017 for breast cancer (a decrease of 48 percent), and from approximately 10.3 million in 2011 to approximately 5.3 million in 2017 for cervical cancer (a decrease of about 49 percent).²⁹ (See fig. 2.) The authors attributed this decrease to insurance coverage expansions under PPACA, such as Medicaid expansion, and the introduction of premium tax credits to purchase private insurance through the new health insurance exchanges, as well as to a decreasing unemployment rate during the study time period.³⁰ The study estimated that the Early Detection Program served 15 percent of all women eligible for breast cancer screening through the program in 2016-2017, an increase from 10.6 percent in 2011-2012, and 6.8 percent of all women eligible for cervical cancer screening through the program in 2015-2017, an increase from 6.5 percent in 2010-2012.³¹ According to CDC officials,

²⁹The study estimated eligibility of women for the program using U.S. Census data, which uses a male/female sex binary; while cisgender women would be included in these estimates, the extent to which transgender men and women would be included is unclear due to the lack of corresponding information about gender identity. These numbers are statistical estimates. The 90 percent confidence intervals for breast cancer are 5.2 – 5.6 million (2011) and 2.6 – 3.0 million (2017). The 90 percent confidence intervals for cervical cancer are 10.0 – 10.6 million (2011) and 5.1 – 5.6 million (2017). Tangka et al., “Eligibility and Reach after the Affordable Care Act.”

³⁰Conversely, an increase in the unemployment rate might increase eligibility for the Early Detection Program. Studies have estimated that job losses associated with the Coronavirus Disease 2019 pandemic are leading to a loss of employer-sponsored health insurance and an increase in the number of uninsured people. While some newly uninsured people may qualify for coverage through Medicaid or coverage assistance in the form of marketplace tax credits, others may remain uninsured, potentially increasing the number of people eligible for the Early Detection Program. See Jessica Banthin et al., *Changes in Health Insurance Coverage Due to the COVID-19 Recession: Preliminary Estimates Using Microsimulation* (Washington, D.C.: Urban Institute and Robert Wood Johnson Foundation, July 2020); The National Center for Coverage Innovation, *The COVID-19 Pandemic and Resulting Economic Crash Have Caused the Greatest Health Insurance Losses in American History* (Washington, D.C.: Families USA, July 17, 2020); and Rachel Garfield et al., *Eligibility for ACA Health Coverage Following Job Loss* (San Francisco, Calif: Kaiser Family Foundation, May 13, 2020).

³¹The authors used these time periods to reflect the frequency at which many women undergo screening, which is every 2 years for breast cancer and every 3 years for cervical cancer. The 90 percent confidence intervals for 2017 are 14.8 – 15.1 percent for breast cancer and 6.7 – 6.8 percent for cervical cancer. The 90 percent confidence intervals for 2012 are 10.4 – 10.9 percent for breast cancer and 6.4 – 6.6 percent for cervical cancer.

people may not receive breast or cervical cancer screenings through the Early Detection Program for a variety of reasons, including lack of knowledge about the need for screening, fear of a cancer diagnosis, lack of trust in health care providers, inconvenient clinic hours, language and cultural barriers, lack of transportation, and lack of clinical providers and services in rural or isolated areas. As we previously reported, some people eligible for the Early Detection Program who are not screened by the program may receive screening from other sources in the community, such as non-profit organizations.³²

³²[GAO-09-384](#).

Figure 2: Estimated Number of People Eligible for the National Breast and Cervical Cancer Early Detection Program, 2011 through 2017

Number of people eligible (in millions)

Source: GAO presentation of data from Tangka et al., "Eligibility and Reach after the Affordable Care Act." | GAO-21-35

According to CDC officials, in order to address these types of barriers and in response to declining trends in the number of people eligible for and screened by the Early Detection Program, CDC expanded the scope of the program beginning in 2017. In addition to screening people for breast or cervical cancer, the program also focuses more broadly on efforts that increase screening among all low-income women—a strategy known as a population-based approach.³³ As part of this program expansion, grantees must implement patient navigation as well as evidence-based strategies to overcome screening barriers and community strategies to link people to clinical services, as recommended in *The Guide to Community Preventive Services*.³⁴ These strategies include community health worker engagement, patient and provider reminders, provider assessment and feedback, one-on-one and group education, small media, reduction of structural barriers, and reduction of out-of-pocket costs.³⁵ CDC officials said they are collecting data from the grantees that will allow them to assess how well they are implementing this new

³³According to CDC, a population-based approach includes strategies that increase screening to all individuals in a target group.

³⁴Community Preventive Services Task Force, *The Guide to Community Preventive Services* (Department of Health and Human Services), accessed August 28, 2020, www.thecommunityguide.org.

Patient navigation is individualized assistance to help overcome barriers and facilitate access; for example, this could include activities such as providing transportation or translation services.

³⁵Community health workers are frontline, culturally competent, public health workers who serve as a bridge between underserved communities and healthcare systems. Patient reminders are written or telephone messages advising people that they are due for screening, and provider reminders inform health care providers that it is time for a client's cancer screening or that a client is overdue for screening. Provider assessment and feedback interventions evaluate provider performance in delivering or offering screening to clients and then provide feedback on that performance. One-on-one and group education consists of conveying information on indications for, benefits of, and ways to overcome barriers to screening with the goal of informing, encouraging, and motivating participants to seek recommended screening. Small media include videos and printed materials, such as letters, brochures, and newsletters, which can be used to inform and motivate people to be screened for cancer. Structural barriers are non-economic burdens or obstacles that make it difficult for people to access cancer screening. Interventions to reduce out-of-pocket costs attempt to minimize or remove economic barriers that make it difficult for people to access cancer screening services.

population-based approach, but because this database was just recently implemented, data are not yet available.³⁶

During the time period examined, while the overall number of people screened decreased, CDC's data show that the share of people screened who were racial or ethnic minorities increased from 53.4 percent in 2011 to 73.2 percent in 2018 for breast cancer and from 54.1 percent in 2011 to 74.8 percent in 2018 for cervical cancer.³⁷ Hispanic people were the largest minority group served by the Early Detection Program in the time period examined, and they made up a larger share of racial and ethnic minorities screened by the program over time, increasing from 49.0 percent of minorities screened for breast cancer in 2011 to 68.9 percent in 2018, and from 50.9 percent of minorities screened for cervical cancer in 2011 to 73.1 percent in 2018. As the CDC data show, although the number of Hispanic people screened by the Early Detection Program decreased, this decrease was much smaller than the decreases for other racial and ethnic groups.³⁸ (See fig. 3.) Similarly, the 2020 study funded by CDC found that the number of Hispanic women eligible for screening through the Early Detection Program decreased by a smaller percentage when compared to other racial and ethnic groups.³⁹ For additional race

³⁶At the time of our review, grantees had not yet submitted their first data submission to CDC.

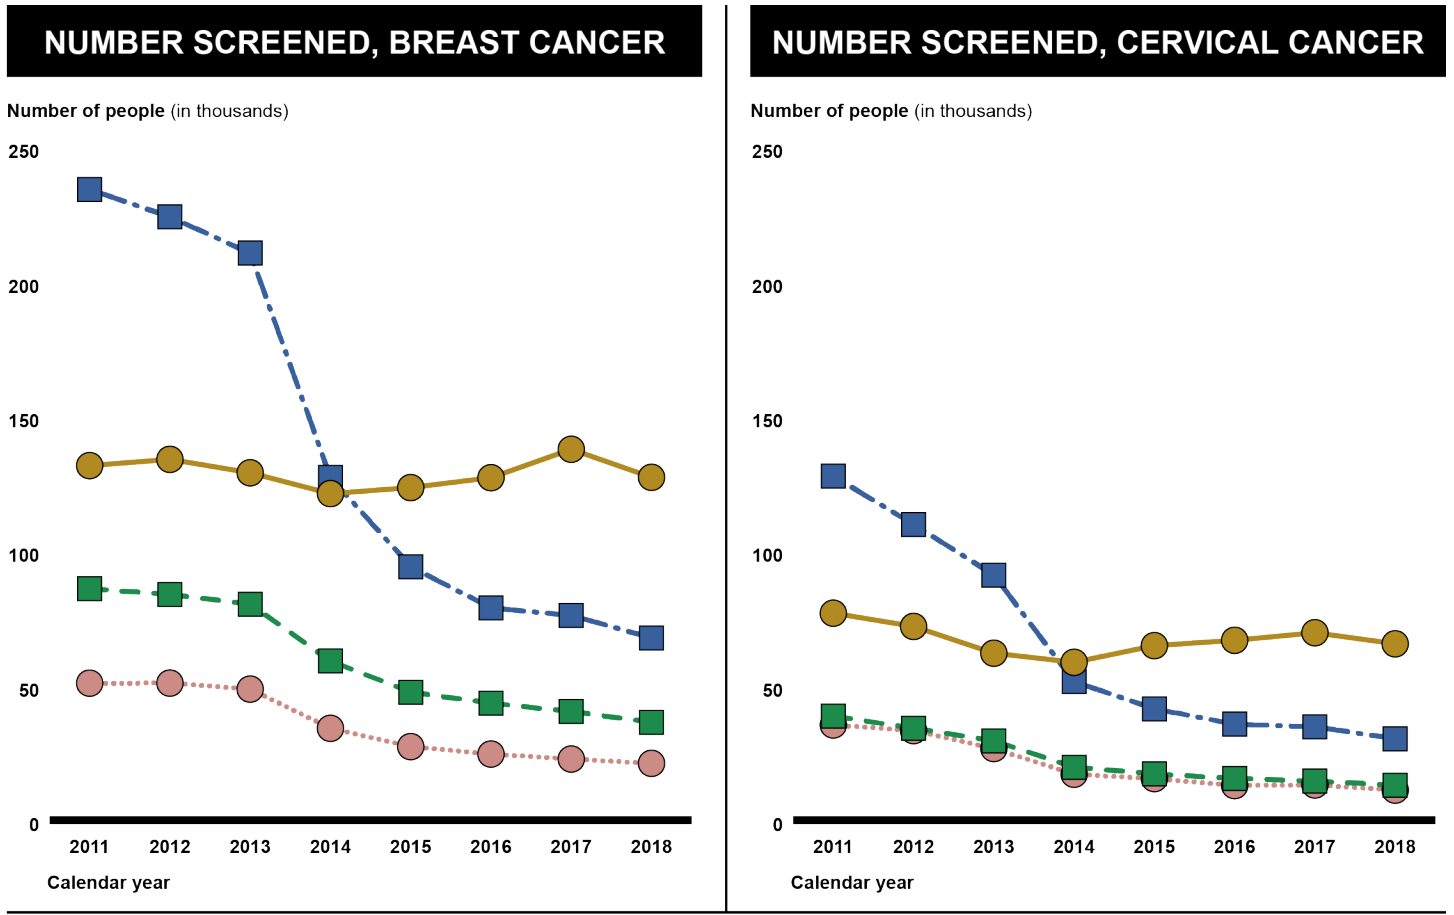

³⁷For our analysis of CDC's data by race and ethnicity, we excluded people screened whose race and ethnicity were identified as "unknown." Race and ethnicity are self-reported by program participants.

³⁸The number of non-Hispanic people screened each year decreased by 66.3 percent and 73.1 percent from 2011 to 2018, for breast and cervical cancer, respectively, whereas the number of Hispanic people screened each year only decreased by 3.3 percent for breast cancer and 14.8 percent for cervical cancer.

³⁹According to the study, the number of Hispanic women eligible for services decreased by 30.4 percent for breast cancer and 37.7 percent for cervical cancer from 2011 to 2017. By contrast, the number of Black, non-Hispanic women eligible for services decreased by 51.5 percent for breast cancer and 48.9 percent for cervical cancer, and the number of White, non-Hispanic women eligible for services decreased by 55.9 percent for breast cancer and 54.9 percent for cervical cancer. Additionally, the percentage of Hispanic women eligible for the program was always higher than the percentage of Black, non-Hispanic women and White, non-Hispanic women eligible. In 2017, the percentage of Hispanic women that were eligible for screening services was about twice as high as the percentage of Black, non-Hispanic women eligible and about four times as high as the percentage of White, non-Hispanic women eligible. While the percentage of women eligible was also higher for Hispanic women than for White, non-Hispanic and Black, non-Hispanic women for 2011 through 2016, the relative difference between these groups was slightly smaller in earlier years.

and ethnicity screening data at the grantee level, see appendix I, tables 4 and 5.

Figure 3: People Screened by CDC’s National Breast and Cervical Cancer Early Detection Program, by Race and Ethnicity, 2011 through 2018

Source: GAO analysis of data from the Centers for Disease Control and Prevention (CDC). | GAO-21-35

Note: People screened whose race and ethnicity were identified as “unknown” are excluded from this figure.

^aIncludes non-Hispanic people from the following racial groups: Asian, Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native, and Multiracial. Also includes Asian/Pacific Islander, a legacy category from an earlier version of CDC’s data collection.

The number of people screened under and eligible for the Early Detection Program also varied according to the states’ Medicaid expansion status.

In general, the number of people screened for breast and cervical cancer decreased more, and the percentage of people eligible for the Early Detection Program was smaller, in states that expanded Medicaid eligibility. CDC's data show that the number of people screened each year by the Early Detection Program decreased more in Medicaid expansion states (54.6 percent from 2011 through 2018) than in states that have not expanded Medicaid (29.2 percent from 2011 through 2018).⁴⁰ Similarly, the 2020 study funded by CDC found that the percentage of women eligible for screening through the Early Detection Program was always higher for states that did not expand Medicaid than for expansion states.⁴¹ However, as noted previously, the 2020 study funded by CDC did not estimate the eligibility of underinsured people. Advocacy groups we spoke with noted that, while the number of uninsured people has decreased since the implementation of PPACA, there may still be many underinsured people who need assistance through the Early Detection Program.

⁴⁰We used Medicaid expansion status information available on the Kaiser Family Foundation's website, which tracks the date when each state's expansion went into effect. These data are current as of February 19, 2020. Kaiser Family Foundation, "Status of State Action on the Medicaid Expansion Decision, July 1, 2020," accessed July 22, 2020, <https://www.kff.org/health-reform/state-indicator/state-activity-around-expanding-medicaid-under-the-affordable-care-act/>. For purposes of this analysis, states were only counted as expansion states if expansion occurred during or before 2018. Although Maine implemented Medicaid expansion on January 10, 2019, retroactive to July 2018, we did not include it as an expansion state in this analysis because the retroactive expansion was only for part of the year.

⁴¹The study estimated that eligibility in states that did not expand Medicaid in 2017 was about double what it was in states that did expand Medicaid. The percentage of women eligible for breast cancer screening in 2017 was estimated to be 3.6 percent in states that did expand Medicaid (90 percent confidence interval: 3.4-3.9 percent) and 7.5 percent (90 percent confidence interval: 7.1-7.9 percent) in states that did not. The percentage of women eligible for cervical cancer screening in 2017 was estimated to be 3.9 percent in states that did expand Medicaid (90 percent confidence interval: 3.7-4.1 percent) and 8.1 percent in states that did not (90 percent confidence interval: 7.8-8.4 percent). While estimated eligibility was also higher for states that did not expand Medicaid for 2011 through 2016, the relative difference was smaller in earlier years, with eligibility in non-expansion states being about one-and-a-half times as high as expansion states in 2011.

About 43,500 People Were Enrolled in Medicaid under the Treatment Act in 2019, and Enrollment Varied by State in Recent Years

According to data from CMS, 43,549 people were enrolled in Medicaid under the Treatment Act to receive treatment for breast or cervical cancer in 2019, a decrease from 50,219 in 2016 (13.3 percent).⁴² CMS data also show that enrollment trends varied by state from 2016 through 2019. Specifically, 37 states experienced a decrease in Medicaid enrollment under the Treatment Act during this time period, 13 states experienced an increase, and one state had no change. (See app. II.)

According to CMS officials, Medicaid expansion is a key factor that contributed to these trends. Specifically, the officials said that, in the states that expanded their Medicaid programs, there were some people who previously would have enrolled in Medicaid based on eligibility under the Treatment Act who instead became eligible for Medicaid through the new adult group created through PPACA.⁴³ The CMS data show that total enrollment under the Treatment Act in Medicaid expansion states decreased by 25.6 percent from 2016 to 2019. In contrast, total enrollment under the Treatment Act in non-expansion states increased by about 1 percent during this time period. Further, 29 of the 34 states that expanded Medicaid had a decrease in enrollment under the Treatment Act from 2016 through 2019.⁴⁴ For some of these Medicaid expansion states, the decrease was larger than others. For example, enrollment in Illinois decreased from 1,441 people in 2016 to 104 people in 2019 (92.8

⁴²We were unable to examine this trend prior to the implementation of PPACA because, according to CMS officials, 2016 was the first year in which a complete calendar year of data became available for all states. CMS data we analyzed for 2016 in Tennessee are based on a different data field than the other states and years due to data reliability concerns with the reported number of individuals enrolled in Medicaid under the Treatment Act.

⁴³According to CMS officials, in Medicaid expansion states, people would only be eligible for Medicaid enrollment under the Treatment Act if they were not already eligible for Medicaid under this new adult group or any of the other Medicaid eligibility groups. However, people who were eligible for and enrolled under the Treatment Act when the state implemented Medicaid expansion may remain in that eligibility group without having their eligibility determined for the new adult group.

⁴⁴For purposes of this analysis, states were only counted as Medicaid expansion states if expansion occurred during or before 2019.

percent), whereas enrollment in Iowa decreased from 197 people in 2016 to 192 in 2019 (2.5 percent).⁴⁵

Additionally, according to CMS, two states that expanded Medicaid—Arkansas and Maryland—opted to discontinue offering Medicaid coverage to the breast and cervical cancer eligibility group under the Treatment Act beginning in 2014, and CMS data show their enrollment under the act subsequently decreased or remained at zero over the time period examined.⁴⁶ This is a change from our 2009 report, where we found that all 50 states and the District of Columbia opted to extend Medicaid coverage to the breast and cervical cancer eligibility group.⁴⁷ Officials from Arkansas and Maryland said the decision to discontinue coverage under the Treatment Act was made because their states expanded Medicaid. In addition, those state officials noted that people screened and diagnosed by the Early Detection Program who did not qualify for Medicaid could obtain insurance under PPACA through their states' health insurance marketplaces.

In addition, CMS officials said that enrollment trends may be affected by changes in state policies for Medicaid eligibility under the Treatment Act, which vary depending upon how the state Early Detection Program grantee defines what it means to be “screened under the Early Detection Program.”⁴⁸ Representatives from one of the advocacy groups we spoke with indicated that, since our 2009 report, some of these states have changed their definition of what it means to be screened under the Early Detection Program. For example, Oregon and Colorado previously limited eligibility to those screened with CDC funds, but, in 2012 and 2014, respectively, the states expanded this eligibility to include people screened by providers not participating in the states' Early Detection

⁴⁵Enrollment changes during the time period examined were small for the four states that expanded Medicaid and had an increase in enrollment under the Treatment Act, with increases ranging from 2.7 to 12.6 percent. The remaining Medicaid expansion state—Arkansas—had no change in enrollment under the Treatment Act during the time period examined.

⁴⁶CMS data show no enrollment under the Treatment Act in Arkansas from 2016 to 2019, while Maryland's enrollment decreased over time. Although Maryland discontinued new enrollment, Maryland officials explained that people enrolled prior to December 31, 2013, and actively in treatment are allowed to continue treatment to completion.

⁴⁷[GAO-09-384](#).

⁴⁸We also previously reported that these differences in state policies for Medicaid eligibility under the Treatment Act could affect enrollment trends. [GAO-09-384](#).

Programs. This expansion of eligibility would likely have increased enrollment under the Treatment Act. However, both states expanded Medicaid in 2014, which would likely have decreased Medicaid enrollment under the Treatment Act due to the new adult group created through PPACA. CMS data show that Medicaid enrollment under the Treatment Act decreased in both Oregon and Colorado from 2016 through 2019.⁴⁹

Finally, in 2016, CMS issued a regulation that may affect states' Medicaid enrollment under the Treatment Act. In 2016, CMS codified eligibility requirements under the Treatment Act based on its January 4, 2001, guidance.⁵⁰ In the preamble to its proposed rule, CMS noted the rule would explicitly provide for coverage of men where the state's Early Detection Program considers men to have been screened under its program.⁵¹ CMS data show that 14 states had at least one man enrolled in Medicaid under the Treatment Act in 2019, for a total of 331 male enrollees.⁵² Further, the 2016 regulation specified that ongoing eligibility for Medicaid under the Treatment Act must be determined by the individual's treating health care professional. Based on that determination, states must dis-enroll people from Medicaid under the Treatment Act if they no longer need treatment for breast or cervical cancer, which could affect enrollment trends.

Agency Comments

We provided a draft of this report to the Department of Health and Human Services for review and comment. The department provided technical comments, which we incorporated as appropriate.

⁴⁹In Oregon, Medicaid enrollment under the Treatment Act decreased from 439 to 250 (43.1 percent) over the time period examined, and, in Colorado, Medicaid enrollment decreased from 252 to 237 (6.0 percent).

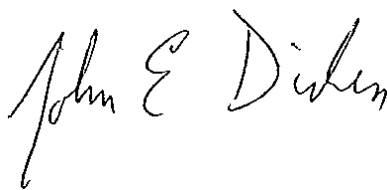

⁵⁰81 Fed. Reg. 86,382, 86,452 (Nov. 30, 2016) (codified at 42 C.F.R. § 435.213).

⁵¹78 Fed. Reg. 4594, 4609 (proposed Jan. 22, 2013)

⁵²According to CMS data, 10 additional states that had no male enrollees under the Treatment Act in 2019 had at least one male enrollee in 2016, 2017, or 2018. The vast majority of male enrollees each year were in Massachusetts, which had 303 men enrolled in Medicaid under the Treatment Act in 2019. Massachusetts covers all individuals with breast and cervical cancer under a section 1115 demonstration project. Section 1115 demonstrations allow states, with CMS approval, to test and evaluate new approaches for delivering services under Medicaid.

As agreed with your office, unless you publicly announce the contents of this report earlier, we plan no further distribution until 30 days from the report date. At that time, we will send copies to the appropriate congressional committees, the Secretary of the Department of Health and Human Services, and other interested parties. In addition, the report will be available at no charge on the GAO website at <https://www.gao.gov>.

If you or your staff have any questions about this report, please contact me at (202) 512-7114 or at dickenj@gao.gov. Contact points for our Offices of Congressional Relations and Public Affairs may be found on the last page of this report. GAO staff who made key contributions to this report are listed in Appendix III.

Note: Data were not available for three grantees (two tribal organizations and one territory) that were new to the Early Detection Program in 2017: Great Plains Tribal Chairmen’s Health Board, American Indian Cancer Foundation, and the Republic of the Marshall Islands.

^aTotal screened is an unduplicated count of all people (all ages) who received screening services funded by CDC’s Early Detection Program. Individuals who received more than one screening service (e.g., both a breast cancer screening and a cervical cancer screening) are only counted once.

^bMassachusetts was given CDC approval to suspend screening for 2016-2018 in order to redesign service delivery. In 2015, the state screened 89 people.

^cFunding for the Poarch Band of Creek Indians ended in 2012.

Source: GAO analysis of Centers for Disease Control and Prevention (CDC) data | GAO-21-35

Note: All numbers are unduplicated, meaning that people who received multiple breast cancer screenings or diagnoses in a single year would be counted once. Because the diagnosis counts sum multiple years of data, individuals could be counted more than once if they received breast cancer diagnoses in multiple years. Numbers include program participants of all ages, including those outside the target breast cancer screening age range of 40 to 64. Data were not available for three grantees (two tribal organizations and one territory) that were new to the Early Detection Program in 2017: Great Plains Tribal Chairmen’s Health Board, American Indian Cancer Foundation, and the Republic of the Marshall Islands.

^aScreenings include all breast cancer screening services (e.g., mammogram, clinical breast exam).

^bThis table excludes 2018 diagnosis data because that data was only available through June 2018. Diagnoses include breast carcinoma in situ (including Lobular Carcinoma in Situ and Ductal Carcinoma in Situ) and invasive cancers. CDC searched for but did not identify any individuals diagnosed with Carcinoma in Situ not otherwise specified.

^cIndividual grantee diagnosis counts do not add to the total due to privacy suppression; to protect patient confidentiality, CDC suppressed individual grantee diagnosis counts in years where the number of diagnoses was between 1 and 9, although those counts were included in “All grantees combined.” Flagged counts are undercounts because they include one or more years in which the diagnosis count was suppressed. Grantee counts are noted as “-” when at least one count was suppressed and other counts were zero for all years from 2011 to 2017.

^dMassachusetts was given CDC approval to suspend screening for 2016-2018 in order to redesign service delivery. In 2015, the state screened 87 people for breast cancer.

^eFunding for the Poarch Band of Creek Indians ended in 2012.

Appendix I: Screening through the Early Detection Program

| Grantee category/grantee | People screened for breast cancer ^a | | | | | | | |
|---|--|------|---------------------|------|----------|------|--|-------|
| | White, non-Hispanic | | Black, non-Hispanic | | Hispanic | | Other races, non-Hispanic ^b | |
| | 2011 | 2018 | 2011 | 2018 | 2011 | 2018 | 2011 | 2018 |
| Native American Rehabilitation Association of the Northwest | 29 | 63 | 9 | 16 | 14 | 22 | 345 | 286 |
| Navajo Nation | 1 | 1 | 0 | 0 | 0 | 0 | 1,166 | 1,125 |
| Poarch Band of Creek Indians ^d | 0 | 0 | 0 | 0 | 0 | 0 | 33 | 0 |
| South Puget Intertribal Planning Agency | 71 | 61 | 0 | 0 | 14 | 8 | 636 | 330 |
| Southcentral Foundation | 56 | 9 | 0 | 0 | 3 | 3 | 1,527 | 1,458 |
| Southeast Alaska Regional Health Consortium | 320 | 337 | 1 | 1 | 25 | 4 | 1,361 | 773 |
| Yukon-Kuskokwim Health Corporation | 15 | 2 | 1 | 0 | 4 | 0 | 903 | 183 |

Source: GAO analysis of Centers for Disease Control and Prevention (CDC) data | GAO-21-35

Note: Numbers include program participants of all ages, including those outside the target breast cancer screening age range of 40 to 64. Data were not available for three grantees (two tribal organizations and one territory) that were new to the Early Detection Program in 2017: Great Plains Tribal Chairmen’s Health Board, American Indian Cancer Foundation, and the Republic of the Marshall Islands.

^aAll numbers are unduplicated, meaning that people who received multiple breast cancer screenings in a single year would be counted once. Screenings include all breast cancer screening services (e.g., mammogram, clinical breast exam).

^bIncludes non-Hispanic people from the following racial groups: Asian, Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native, and Multiracial. Also includes Asian/Pacific Islander, a legacy category from an earlier version of CDC’s data collection. People whose race/ethnicity was marked unknown are excluded from this table; there were 5,540 people of unknown race/ethnicity screened for breast cancer in 2011 across all grantees, decreasing to 3,072 in 2018.

^cMassachusetts was given CDC approval to suspend screening for 2016-2018 in order to redesign service delivery. In 2015, the state’s screening numbers for breast cancer were eight (white, non-Hispanic), five (black, Non-Hispanic), 71 (Hispanic), and two (other races, non-Hispanic).

^dFunding for the Poarch Band of Creek Indians ended in 2012.

**Appendix I: Screening through the Early
Detection Program**

Table 5: Race/Ethnicity of People Screened for Cervical Cancer by National Breast and Cervical Cancer Early Detection Program Grantees, 2011 and 2018

| Grantee category/grantee | People screened for cervical cancer ^a | | | | | | | |
|------------------------------|--|--------|---------------------|--------|----------|--------|--|--------|
| | White, non-Hispanic | | Black, non-Hispanic | | Hispanic | | Other races, non-Hispanic ^b | |
| | 2011 | 2018 | 2011 | 2018 | 2011 | 2018 | 2011 | 2018 |

| Wyoming | 105 | 78 | -25.7 | Non-expansion |

Source: GAO analysis of Transformed Medicaid Statistical Information System Analytic File from the Centers for Medicare and Medicaid Services (CMS) | GAO-21-35

Note: Data were accessed on September 2, 2020. We analyzed the Medicaid enrollment data as they were reported by states to CMS. We did not otherwise independently verify the accuracy or completeness of the Medicaid enrollment information with the states.

^aNumber of people enrolled in Medicaid through the “Certain Individuals Needing Treatment for Breast or Cervical Cancer” eligibility group during at least one month of the year.

^bWe used Medicaid expansion status information available on the Kaiser Family Foundation’s website, which tracks the date when each state’s expansion went into effect. These data are current as of February 19, 2020. Kaiser Family Foundation, “Status of State Action on the Medicaid Expansion Decision, July 1, 2020,” accessed July 22, 2020, <https://www.kff.org/health-reform/state-indicator/state-activity-around-expanding-medicaid-under-the-affordable-care-act/>. For purposes of this analysis, states were only counted as expansion states if expansion occurred during or before 2019.

^cArkansas and Maryland both opted to discontinue offering Medicaid coverage under the Breast and Cervical Cancer Prevention and Treatment Act in 2014. Maryland officials explained that people enrolled prior to December 31, 2013, and actively in treatment are allowed to continue treatment to completion.

^dCMS data we analyzed for 2016 in Tennessee are based on a different data field than the other states and years due to data reliability concerns with the reported number of individuals enrolled in Medicaid under the Treatment Act.

Appendix III: GAO Contact and Staff Acknowledgments

GAO Contact

John E. Dicken, (202) 512-7114 or dickenj@gao.gov.

Staff Acknowledgments

In addition to the contact named above, Karin Wallestad (Assistant Director), Sarah-Lynn McGrath (Analyst-in-Charge), Isabella Guyott, and Julianne Flowers made key contributions to this report. Also contributing to this report were Kristen Anderson, Laurie Pachter, Vikki Porter, and Jennifer Whitworth.

GAO's Mission

The Government Accountability Office, the audit, evaluation, and investigative arm of Congress, exists to support Congress in meeting its constitutional responsibilities and to help improve the performance and accountability of the federal government for the American people. GAO examines the use of public funds; evaluates federal programs and policies; and provides analyses, recommendations, and other assistance to help Congress make informed oversight, policy, and funding decisions. GAO's commitment to good government is reflected in its core values of accountability, integrity, and reliability.

Obtaining Copies of GAO Reports and Testimony

The fastest and easiest way to obtain copies of GAO documents at no cost is through our website. Each weekday afternoon, GAO posts on its [website](#) newly released reports, testimony, and correspondence. You can also [subscribe](#) to GAO's email updates to receive notification of newly posted products.

Order by Phone

The price of each GAO publication reflects GAO's actual cost of production and distribution and depends on the number of pages in the publication and whether the publication is printed in color or black and white. Pricing and ordering information is posted on GAO's website, <https://www.gao.gov/ordering.htm>.

Place orders by calling (202) 512-6000, toll free (866) 801-7077, or TDD (202) 512-2537.

Orders may be paid for using American Express, Discover Card, MasterCard, Visa, check, or money order. Call for additional information.
